

# First Challenge

Welcome to our first React Native challenge

## Introduction

Thinking of a project that has a list of "Posts", containing an image, title and a previous description of it. Each post needs to have the list of comments that users left when entering that specific post.

The challenge consists of:

1. Create a "Posts" home page with a listing of posts where each post should contain a link to a second "Post Details" screen.
2. Create a "Post Details" screen which should contain details of the post, the comments related to it with the user's email and a link that returns to the previous screen.

In a data.ts file (TypeScript), create a list of posts with the following information.

## List of posts with:

1. id - numeral
2. title - text
3. imageUrl - text
4. body - text

**List of comments with:**

1. id - numeral
2. postId - numeral
3. email - text
4. body – text

The styling will be at the developer's discretion, but you should use the main tools that CSS provides.
